WHATSAPP INTEGRATION API

A simple, developer-friendly way to send WhatsApp messages and OTPs from your software.

OVERVIEW
Maddy Developers helps businesses, startups, and software teams connect WhatsApp messaging to their existing websites, mobile apps, and SaaS platforms. Your application sends authenticated API requests, and messages or OTPs are delivered through your connected WhatsApp number.

Core Features

01 **API-Based Integration**

Use the API origin and API token supplied after purchase to authenticate requests from your software. Follow the official documentation for supported endpoints and request formats.

02 **WhatsApp Messages & OTPs**

Trigger WhatsApp messages and one-time passwords directly from your existing application workflows, such as login verification, order updates, and customer notifications.

03 **Works With Your Software**

Integrate with websites, mobile apps, SaaS products, and other business systems. Your development team can implement the integration manually or use an AI coding agent to assist.

SERVICE OPTIONS & INTEGRATION FLOW

Choose the session model that matches your messaging requirements.

SINGLE-SESSION SERVICE

One connected WhatsApp number

- Send messages and OTPs through a single connected number.
- Best for a single business, application, or communication channel.

MULTI-SESSION SERVICE

Multiple connected WhatsApp numbers

- Send messages and OTPs through different connected numbers.
- Suitable for platforms managing multiple businesses or channels; limits depend on the purchased plan.

How Integration Works

1	**Purchase** Choose Single-Session or Multi-Session service.
2	**Receive Access** Get your API origin, API token, and official integration guide.
3	**Connect WhatsApp** Connect the number(s) covered by your selected service.
4	**Integrate** Your developer or AI coding agent follows the guide and adds the required API calls.
5	**Authenticate & Send** Your software authenticates each request and sends messages or OTPs through the connected number(s).

Developer Notes

- Use the official guide for authentication headers, endpoints, request formats, and error handling.
- Keep API tokens secure; do not expose them in public-facing frontend code.
- Available functionality and session limits depend on the purchased service plan.
